

CRAYORA APP STUDIO
MULTI-SALON SAAS PLATFORM

CRAY SALON BLUEPRINT

Ek app, saare salon — one-time customer ko repeat customer banane ka SaaS system

Not a single-salon booking app. A **multi-tenant SaaS** retention platform — one app that serves every salon, each fully isolated. Prepaid wallet, smart reminders, add-ons, referrals, loyalty and an owner dashboard.

MULTI-TENANT SAAS	FLUTTER + SUPABASE
ZERO-TOUCH ONBOARDING	PUSH-FIRST MESSAGING

Includes multi-tenancy with RLS isolation, wallet ledger, push notifications, packages & loyalty, referral validation, owner dashboard, Crayora super-admin console, database schema, automations, message templates, subscription pricing, 30-day pilot and a Claude Code build brief.

PREPARED SEPTEMBER 2026 · VERSION 3.0 · © CRAYORA

THE PROBLEM

App kya problem solve karta hai?

Most local salons have three hidden revenue leaks:

- Customer service ke baad chala jaata hai, lekin uska proper record nahi banta.
- Salon customer ko next visit ke right time par remind nahi karta.
- Customer sirf basic service leta hai kyunki useful add-ons booking ke time dikhte hi nahi.

Cray Salon closes all three — and adds more

- Customer ka name, phone, service & last-visit date save karta hai.
- Prepaid store-credit se wapas aane ka reason deta hai.
- Right time par push reminder bhejta hai (free), WhatsApp fallback ke saath.
- Booking ke time relevant add-ons, packages & memberships dikhata hai.
- Happy customers se trackable referrals generate karta hai.
- Owner ko simple numbers mein performance dikhata hai — cohort retention ke saath.

ONE-LINE TRANSFORMATION

Walk-in customer → saved customer → prepaid balance → timely reminder → repeat booking → add-on / package sale → referral → **measurable revenue**.

WHAT'S NEW IN THE CRAYORA VERSION

- One app, all salons — true multi-tenant SaaS, not one build per shop.
- Zero-touch onboarding — owner sets up his own salon, no Crayora help.
- Push-first messaging — free FCM push before paid WhatsApp.
- Packages, memberships & loyalty for stickier repeat revenue.
- Cloud stack — Flutter, Supabase, Cloudflare R2, Razorpay.
- Subscription SaaS — recurring revenue, not one-time setup only.

WHO USES IT

App kaun use karega?

CUSTOMER

- Mobile number se OTP login.
- Credit, bookings, offers, referral, packages & loyalty.
- One tap mein next appointment book.

SALON OWNER / MANAGER

- Customers, bookings, services, staff manage.
- Reminder queue & business dashboard.
- Wallet adjust, refund, referral approval (audited).

BARBER / STAFF

PHASE 2 APP

- Apna schedule & assigned bookings.
- One-tap service complete + commission view.
- Optional add-on / bill updates.

CRAYORA SUPER-ADMIN

INTERNAL

- Cross-tenant health, support, billing.
- Suspend / reactivate a salon — data retained.
- Platform metrics; every access audit-logged.

★ ZERO-TOUCH SELF-SERVE ONBOARDING — THE SAAS UNLOCK

Any owner installs the app and provisions a fully-isolated salon in minutes, with **no Crayora involvement**. If Crayora ever has to touch a database to activate a salon, this has failed.

Download → **OTP verify** → salon basics → **auto-create tenant** → guided wizard (defaults) → QR link + trial starts

For the first MVP, customer + owner roles are enough. The barber app and super-admin console follow.

THE FOUNDATION

Multi-tenancy — one app, many salons

This is the single most important upgrade. It is poured on Day 1, never retrofitted. Every salon is a **tenant**; every row of data belongs to exactly one salon and no owner can ever see another's data.

KEEP THESE SEPARATE

- Tenant = one paying salon business (Day 1).
- Branch = one owner, many locations (Phase 3).

ISOLATION MODEL

- Shared database, shared schema, row-level.
- Every table carries a `salon_id`.
- Cheapest & correct for this market.

Two defenses — both required

- Row-Level Security (RLS) — Postgres policies make the database itself refuse rows outside the caller's salon, even if app code has a bug. A forgotten filter must never leak Salon A's customers to Salon B.
- Tenant-scoped data layer — no raw query reaches the DB without the salon scope applied.

```
alter table customers enable row level security;

create policy tenant_isolation_customers on customers
  using      (salon_id = (auth.jwt() ->> 'salon_id')::uuid)
  with check (salon_id = (auth.jwt() ->> 'salon_id')::uuid);
```

Apply an equivalent policy to every table — and write a test that logs in as Salon A and asserts it receives zero of Salon B's rows.

THE STACK

Chosen tech stack

Every layer is managed or serverless. No self-run servers at pilot stage.

Layer	Choice	Why (for this app)
App	Flutter / Dart → Play Store	Install-first native, one codebase, official Supabase & Razorpay plugins.
Auth	Supabase Auth	Free to 50K MAU; and it is the backbone RLS reads for tenant isolation.
DB + isolation	Supabase Postgres + RLS	Relational ledger data; RLS enforces salon_id isolation in the database.
File storage	Cloudflare R2	Zero egress fees — logos, photos, invoices. Signed URLs for private files.
Serverless logic	Supabase Edge Functions	Webhooks, referral validation, daily summary, and all messaging calls live here.
Payments	Razorpay	India-standard UPI / cards, refunds and webhooks for the wallet flows.
Messaging	Message Central	Meta-approved WhatsApp BSP + SMS + OTP, one provider for India.
Push	Firebase Cloud Messaging	Free native push — the primary channel; WhatsApp is fallback.

GOLDEN RULES

- Secrets (Message Central, Razorpay, R2, FCM) live server-side only — never in the APK.
- Call Message Central & Razorpay only from Edge Functions.

DATA VS FILES

- Database, auth, RLS → Supabase.
- Files (logos, photos) → Cloudflare R2. R2 cannot replace the database.

CORE SCREENS

The core screens

1 My Salon Wallet

Keep some customer value locked with the salon so choosing a competitor next time costs them. A **store-credit ledger, not a cash wallet** — non-withdrawable.

- Available credit, name & mobile.
- Last visit & last service.
- Add Money · Use at Checkout.
- Full transaction history.
- Book Next Visit.
- Offer + clear terms & expiry.
- Paid vs bonus shown separately.
- Refund = new ledger entry, never a delete.

Example: pays ₹500 → salon bonus ₹50 → available credit ₹550. Closed-loop keeps it outside RBI PPI licensing.

2 Smart Reminder & Quick Booking

An **expected** service-due reminder, not random promotion. Prefer free push; WhatsApp only on fallback or opt-in.

Service	Example cycle	Service	Example cycle
Haircut	25-35 days	Hair colour	25-45 days
Beard trim	10-15 days	Facial	30-45 days

Upgrade: after 2+ visits, learn each customer's actual interval from history instead of a fixed cycle. Owner sets timing; one reminder per cycle; booking stops duplicates; opt-out anytime.

3 Booking Add-ons

Relevant, transparent add-ons at the **booking decision time** — not a post-checkout upsell.

- Main service, price & duration.
- Suggested add-ons with price + extra time.
- Running total & selected staff / slot.
- Add-ons never pre-selected.
- Total + duration update instantly.
- Only relevant suggestions shown.

Example: Beard trim +₹99 · Head massage +₹199. Owner can toggle, re-price and limit add-ons by staff.

Metric: average bill value = completed revenue ÷ completed bills. Also track add-on acceptance rate, top add-on, add-on revenue by staff.

4 Refer & Earn

Turn a happy customer into a measurable, low-cost acquisition channel.

- Personal referral link / code.
- WhatsApp share button.
- Pending & successful referrals, earned reward.
- Reward stays Pending until a paid first visit.
- No self-referral; one referrer per new customer.
- Cancelled / refunded don't qualify; owner monthly cap.

Example: existing customer gets ₹100 credit · new customer gets ₹100 off. Real control = paid-visit gate + non-cash credit.

Reward logic: share code → friend registers → Pending → friend completes & pays first service → only then Successful & both rewards released.

5 Owner Dashboard

Useful numbers for daily decisions — not complicated reports.

TODAY'S REVENUE

TODAY'S BOOKINGS

AVERAGE BILL VALUE

REPEAT / NEW THIS MONTH

WALLET CREDIT COLLECTED

OUTSTANDING CREDIT

- Barber-wise revenue & completed services.
- Top 20 customers by spend.
- Customers whose next visit is due.
- Popular services & add-ons.
- Referral sign-ups & successes.
- Cancelled & missed appointments.
- Wallet adjustments & refund history.
- Reminder-generated bookings.

UPGRADE — COHORT RETENTION VIEW

Of customers acquired in month X, the % returning in 30 / 60 / 90 days, **split wallet vs non-wallet**. This is the number that proves the loop and justifies the subscription — a flat “repeat this month” count can’t.

One-tap owner actions

Add / edit customer

Walk-in booking

Mark service complete

Send approved reminder

Adjust wallet (reason required)

Refund / cancel

Export report

Mark-complete must be one tap from the day view — and must work offline. Every automation depends on it.

FEATURE ROADMAP

Everything, **tiered**

Keep the MVP lean; ship advanced features only after the loop proves itself.

TIER 1 — MVP (THE LOOP)

Zero-touch onboarding · OTP login · customer profiles & history · service catalogue · booking + slots · add-ons · salon-credit wallet · service reminders · referral · owner dashboard + cohort view · immutable audit · **push notifications** · subscription/billing · multi-language (EN/HI/Hinglish) · offline mark-complete.

TIER 2 — PHASE 2 (DEEPEN RETENTION & REVENUE)

Memberships & prepaid packages · **loyalty points/tiers** · waitlist & walk-in queue · **lifecycle automation** (birthday, anniversary, win-back) · feedback/NPS + review routing · **staff app + commission** · GST invoicing / digital receipts · photo gallery (with consent) · advanced analytics · granular permissions · home-service booking.

TIER 3 — PHASE 3 (SCALE & NETWORK)

Multi-branch · gift cards (legal review first) · inventory & retail · dynamic / off-peak pricing · campaign builder · referral leaderboard · white-label apps (premium) · AI hairstyle recommendations · WhatsApp two-way booking chatbot.

The biggest risk with a roadmap this rich is feature-bloat delaying launch. Ship the Tier 1 loop first — everything else waits.

END TO END

Complete customer journey

Step	What happens
1 · First visit	Owner saves name + mobile, explains why, records the completed service.
2 · Wallet offer	At checkout the customer takes the salon-credit offer (pay ₹500, get ₹550).
3 · Visit record	App stores service, amount, date, barber, payment status.
4 · Smart reminder	App computes the due date and sends a push reminder with a one-tap booking link.
5 · Booking + add-on	Customer picks a slot and sees relevant add-ons / packages with exact price & duration.
6 · Repeat visit	Pays via package → wallet → UPI. App updates wallet, loyalty and visit history.
7 · Referral	After a successful visit, a simple Refer & Earn invitation goes out.
8 · Owner loop	Dashboard shows which reminders, services, add-ons and staff drive repeat business.

RECORD → RETURN REASON → REMIND → RAISE THE BILL → REFER → MEASURE

DATA MODEL

Database blueprint

Every table carries **salon_id** and is protected by RLS. Never delete — use statuses.

Table	Essential information
salons (tenant)	Name, logo, address, hours, wallet/reward/loyalty rules, languages, status.
users	Auth id, salon_id, role (owner/manager/staff), permissions.
subscriptions	Plan, status, trial_ends_at, renews_at, message allowance/used.
customers	Name, phone, consent, birthday?, last visit, loyalty points, tier, language.
services / add-ons	Name, category, price, duration, repeat-cycle, relevance, active.
staff	Name, hours, skills, commission rule, active.
bookings / visits	Customer, services, add-ons, staff, datetime, status, total, payment, tip.
wallet_transactions	Paid credit, bonus credit, debit, refund, reason, balance after (append-only).
referrals / reminders	Referrer, referred, code, status, reward · reminder type, channel, delivery.
packages / loyalty_ledger	Prepaid bundles & memberships · append-only points earn/redeem.
feedback / invoices / photos	NPS & ratings · GST invoices · before/after photos (with consent).
audit_log / notification_tokens	Every adjustment logged · device FCM tokens for push.

Statuses — Booking: Pending/Confirmed/Completed/Cancelled/No-show · Referral: Invited/Registered/Pending/Rewarded/Rejected · Wallet: Pending/Credited/Debited/Refunded/Reversed · Reminder: Scheduled/Sent/Delivered/Failed/Converted/Opted-out.

AUTOMATIONS

Must-have automations

All run in Supabase Edge Functions.

Trigger	Actions
A · Visit completed	Update last-visit; add to history; compute next visit; schedule reminder; award loyalty; decrement package; update staff commission & revenue.
B · Wallet top-up (Razorpay webhook)	Record paid + bonus separately; recalc balance; send receipt.
C · Booking confirmed	Reserve slot; push notify; stop duplicate reminder for that cycle.
D · Referral visit completed	Validate; credit both rewards; notify both customers.
E · Daily owner summary	Revenue, completed/missed, new vs repeat, add-on + package revenue, tomorrow's count.
F · Lifecycle scan	Birthday, anniversary, win-back (lapsed), package-expiry nudges.
G · Waitlist opening	Notify the next waitlisted customer on a cancellation.
H · Post-visit feedback	Send rating request; route happy → public review, unhappy → private owner alert.
I · Subscription lifecycle	Trial-ending nudge; past-due dunning; suspend on non-payment.

MESSAGING & NOTIFICATIONS

Push-first messaging

Channel priority protects margin: **Push (free)** → WhatsApp (paid, opt-in) → SMS (fallback). OTP always via Message Central.

PUSH · FCM

Confirmations, reminders, receipts.
Free & native — the default.

WHATSAPP · BSP

Fallback / marketing. Opt-in + Meta
template approval required.

SMS + OTP

OTP login (no DLT); SMS reminders
need DLT registration.

Templates (keep short, useful, permission-based)

Reminder: Hi {{name}}, your last {{service}} at {{salon}} was on
{{last_visit}}. Slot open {{suggested_date}}. Book: {{link}}

Receipt: Rs.{{paid}} received. Rs.{{bonus}} bonus added.
{{salon}} credit: Rs.{{balance}}. Details: {{wallet_link}}

Booking: {{service}} booked {{date}} {{time}} with {{staff}}.
Total Rs.{{total}}. Manage: {{booking_link}}

Referral: Your friend completed their first visit. Rs.{{reward}}
credit added. New balance: Rs.{{balance}}.

Launch blockers: draft & submit WhatsApp templates for Meta approval early; DLT-register SMS; capture withdrawable opt-in (also a DPDP requirement). Never send marketing to customers who haven't opted in.

BUILD BRIEF

Build with Claude Code

Hand this to Claude Code — an agentic coding tool that reads the codebase, edits files and runs commands. Add a **CLAUDE.md** at the repo root, then build one milestone per session.

M	Milestone
0	Repo + CLAUDE.md + Flutter + Supabase + FCM wired; i18n scaffold.
1	Full schema + RLS policies + cross-tenant leak test.
2	Auth: Supabase phone-OTP via Message Central; OTP rate-limiting.
3	★ Zero-touch onboarding — provisions a tenant, no human in loop.
4-5	Services, staff, customers, visits; booking + slots + add-ons; offline queue.
6-7	Wallet ledger + Razorpay + receipts; reminders (push-first) + automations A/C.
8-9	Refer & Earn; owner dashboard + cohort view + daily summary.
10-11	Subscriptions/billing + dunning; Crayora super-admin console.
12-13	DPDP consent/export/delete, observability, release states, Play Store build.
14+	Tier 2/3 features — packages, loyalty, staff app, GST, campaigns, branches.

Ship M0-M9 with simulated payments = the working prototype; wire real Razorpay + approved templates + DLT before public release.

BUSINESS MODEL

Subscription pricing

A starting proposal to validate in the pilot — verify Razorpay & Message Central costs before locking. Push is free, which keeps margins healthy.

Plan	Price (proposed)	Included	WhatsApp / mo
Starter	₹0 trial → ₹399/mo	1 salon, core loop, unlimited push	200, then pass-through
Growth	₹799/mo	+ packages, loyalty, lifecycle, feedback	750
Pro	₹1,499/mo	+ staff app, commission, GST, campaigns, home-service	2,000

FREE TRIAL

- 14 days, full Growth features, no card.
- Provisioning + trial start in one step.

TRIAL / NON-PAYMENT

- Grace read-only 7 days → suspend.
- Data retained 90 days, then deleted with notice.

OWNER PITCH

“Sir, yeh sirf booking app nahi hai. Customer ka record banta hai, right time par reminder jaata hai, booking par useful add-ons dikhte hain, aur referral se naye customers track hote hain. Dashboard mein repeat customers, average bill aur staff performance dikhta hai. Pehle 14 din free test — useful result dikhe tabhi continue kariye.”

PROVE IT

30-day pilot & launch checklist

30-day pilot

Record baseline first: avg bill, repeat-visit gap, weekly customers, no-shows, current referral method.

- W1 — setup + train owner on one workflow.
- W2 — wallet + reminders; check payment/refund/balance daily.
- W3 — add-ons + referrals for completed customers.
- W4 — compare vs baseline; keep only what got used.

Launch checklist

- Cross-tenant isolation test passes.
- Zero-touch onboarding needs no Crayora action.
- Add-ons never pre-selected; reward after paid visit only.
- Failed-payment & refund flows tested.
- Push delivered; WhatsApp fallback only when needed.
- Consent + opt-out + DPDP export/delete work.
- Dashboard totals match transactions.
- No secret keys in the build.

OWNER DISCOVERY — ASK BEFORE BUILDING

Ten common services + prices + durations · repeat cycles · how they book today · barbers per shift · main cancellation cause · two best-margin add-ons · safe wallet amount + bonus · when a referral reward is valid · which daily numbers they want · who marks services complete · GST registered? · preferred languages.

THE REAL PROMISE

**The value is not an app
with five screens.
It is a connected business loop.**

Record the customer → give a reason to return → remind at the right time →
raise the bill transparently → earn referrals → show the owner what worked —
across every salon, from one app.

Build that loop first. Everything else is optional.

CRAYORA · CRAY SALON

Multi-salon SaaS retention platform · Version 3.0 · September 2026
